Algorithm

Analysis of Algorithms

Lecture No.- 02

By- Aditya sir

Recap of Previous Lecture

Topic

Introduction to course

Topic

Algorithm Concept

Topic

Algorithm Lifecycle Steps

P4A

Topics to be Covered

Topic

Need to Analysis

[why & what]

Topic

Methodology of Analysis

[How?]

Topic

Types of Analysis

Topic : Analysis of Algorithms

Need for Analysis (why?)

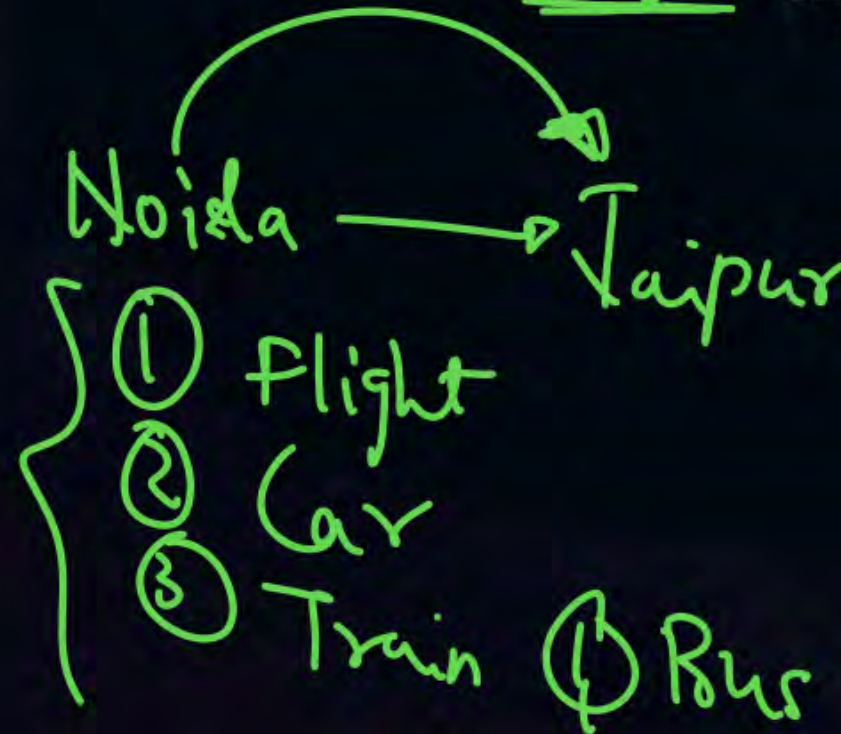

1. To Determine
Resource
Consumption

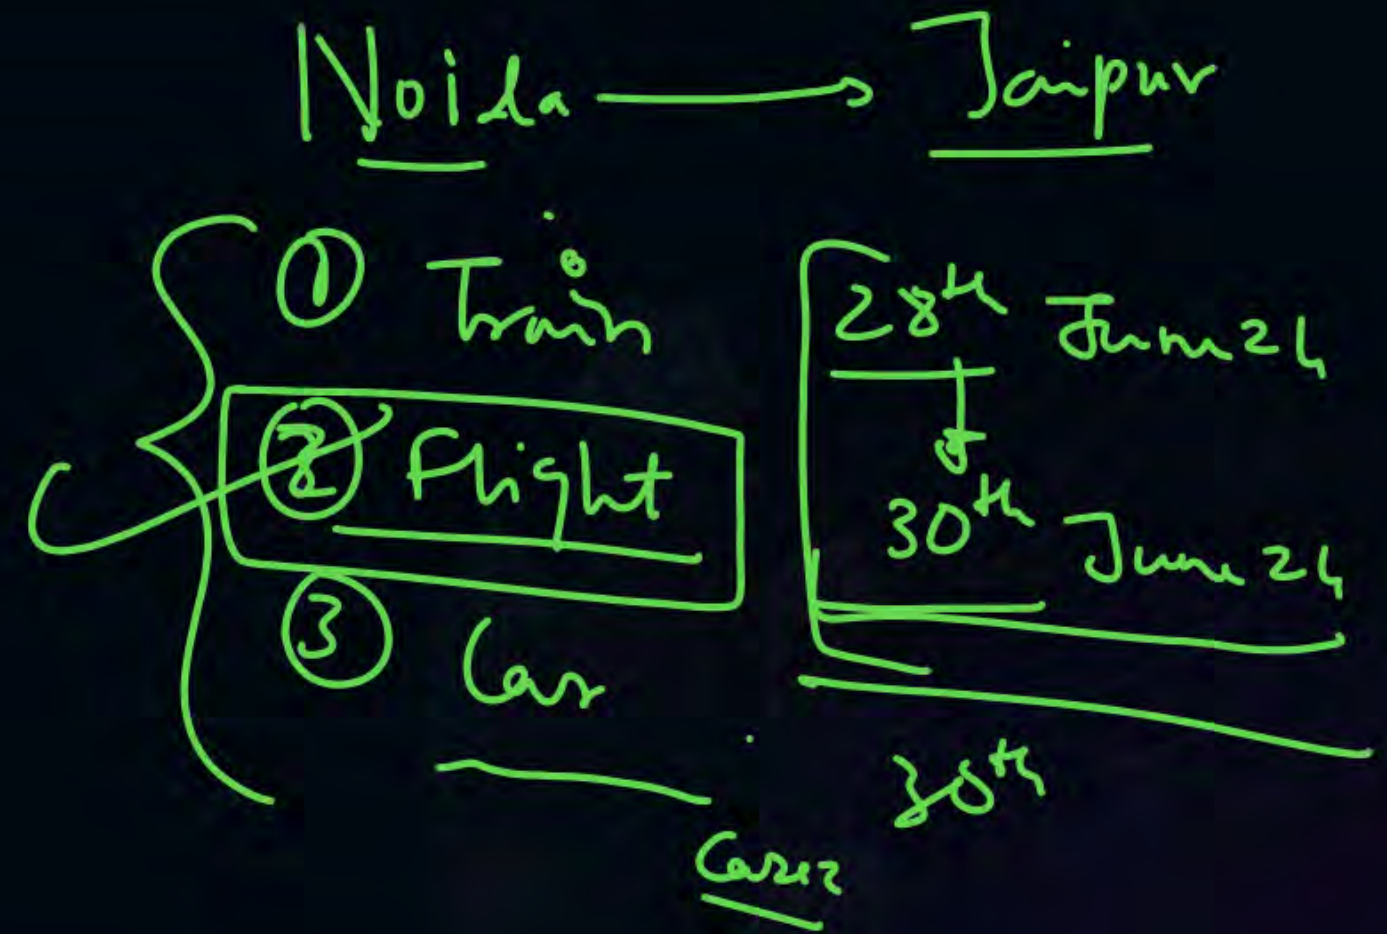

(what)

< Time, Space,
Cost,
Bandwidth... >

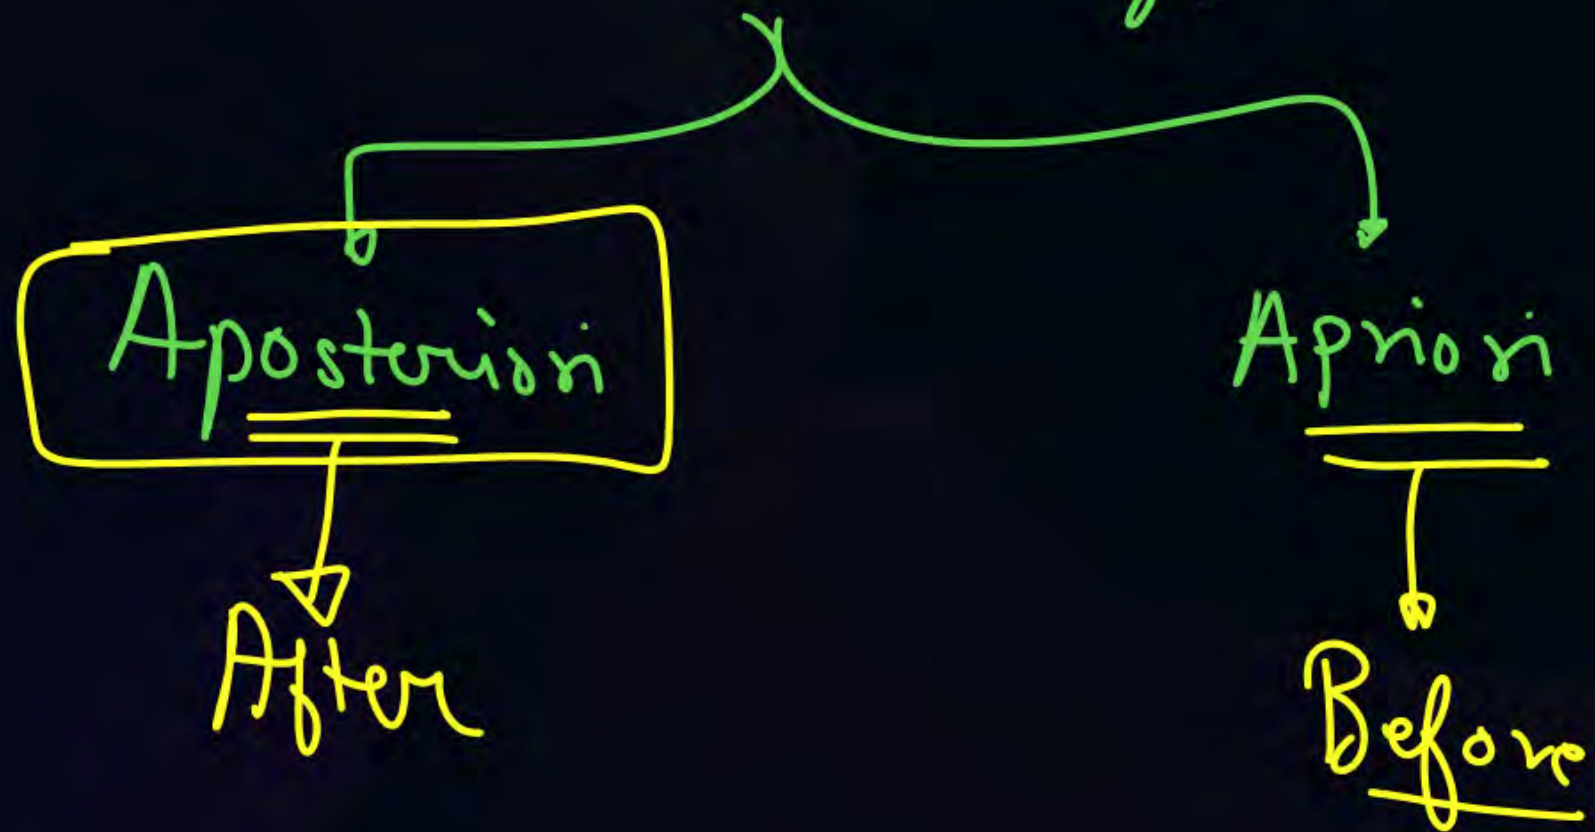

2. Performance comparison
to find out efficient
algorithm

(why?)

How to Analyse (Methodology)

① Aposteriori Analysis

↳ Depends upon

- ① Environment
- ② Platforms

Depends upon: $a = b * c$

① Programming lang

② OS (Mac, windows, linux)

③ Hardware → (CPU, memory, etc.)

① → Human
② → Computer

Noida → Jaipur

How?

- ① Flight → 2hr
- ② Train → 10hrs
- ③ Car → 18hrs
- ④ Walk →

A posteriori Analysis

$\left[\begin{matrix} S/W \\ M/W \end{matrix} \right] \rightarrow$ performance comparison

Advantages

- ① It gives us exact value in real units

Drawbacks / Limitation^{becomes} Difficult

- ① It is difficult to carry out.
- ② Cannot consider for all cases of inputs.
- ③ Platform Dependent

Topic : Analysis of Algorithms

~~A posteriori Analysis~~ → Platform Independent
Apriori Analysis

Analytic Framework:

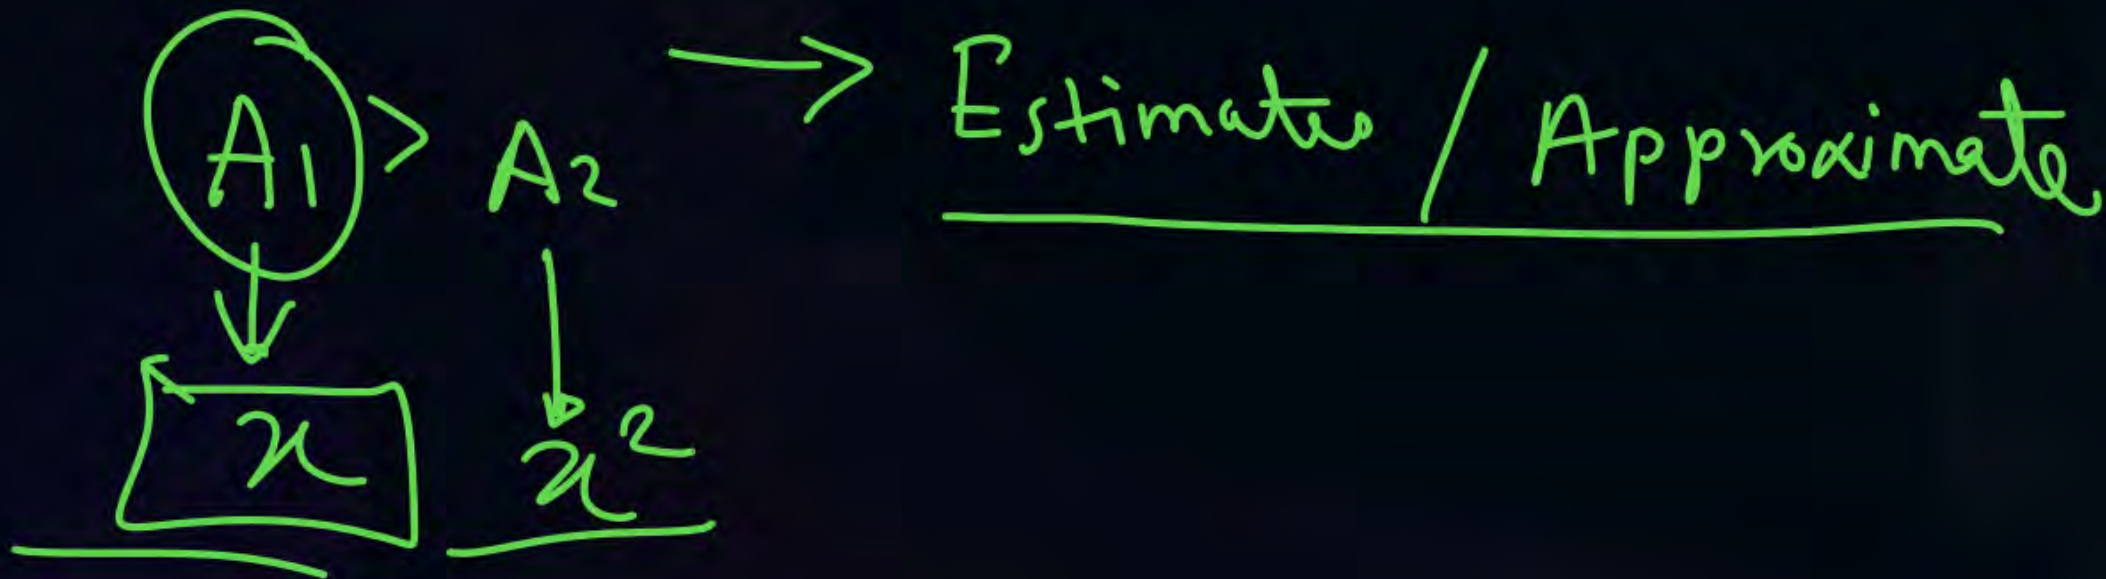

- ① Taken into account all the possible inputs.
- ② It allows us to Compare the relative efficiency/
of two Algorithms (Performance)
- ③ It can be Carried out by studying the high level
description of Algo without actual implementation.
- ④ It is easy to carry out

Topic : Analysis of Algorithms

Drawback: Approx Analysis

① Will not give real/actual values in units

Topic : Analysis of Algorithms

Components of Analytic Framework:

- ① Need a Pseudo language for Describing Algo steps

$$\begin{array}{l} a = b + c \\ \hline a \leftarrow b + c \end{array}$$
- ② A Computational model that the Algo executes within it
- ③ A metric for measuring Algo running time
- ★ ④ A notation to categorize this running time.

Topic : Analysis of Algorithms

Algorithm Test (n)

{
1. $a = b + c$

2 units (Const)

CPU / memory

2. for $i: 1 \rightarrow n$
 $a = b + c$

$1 + (n+1) + n + 1$

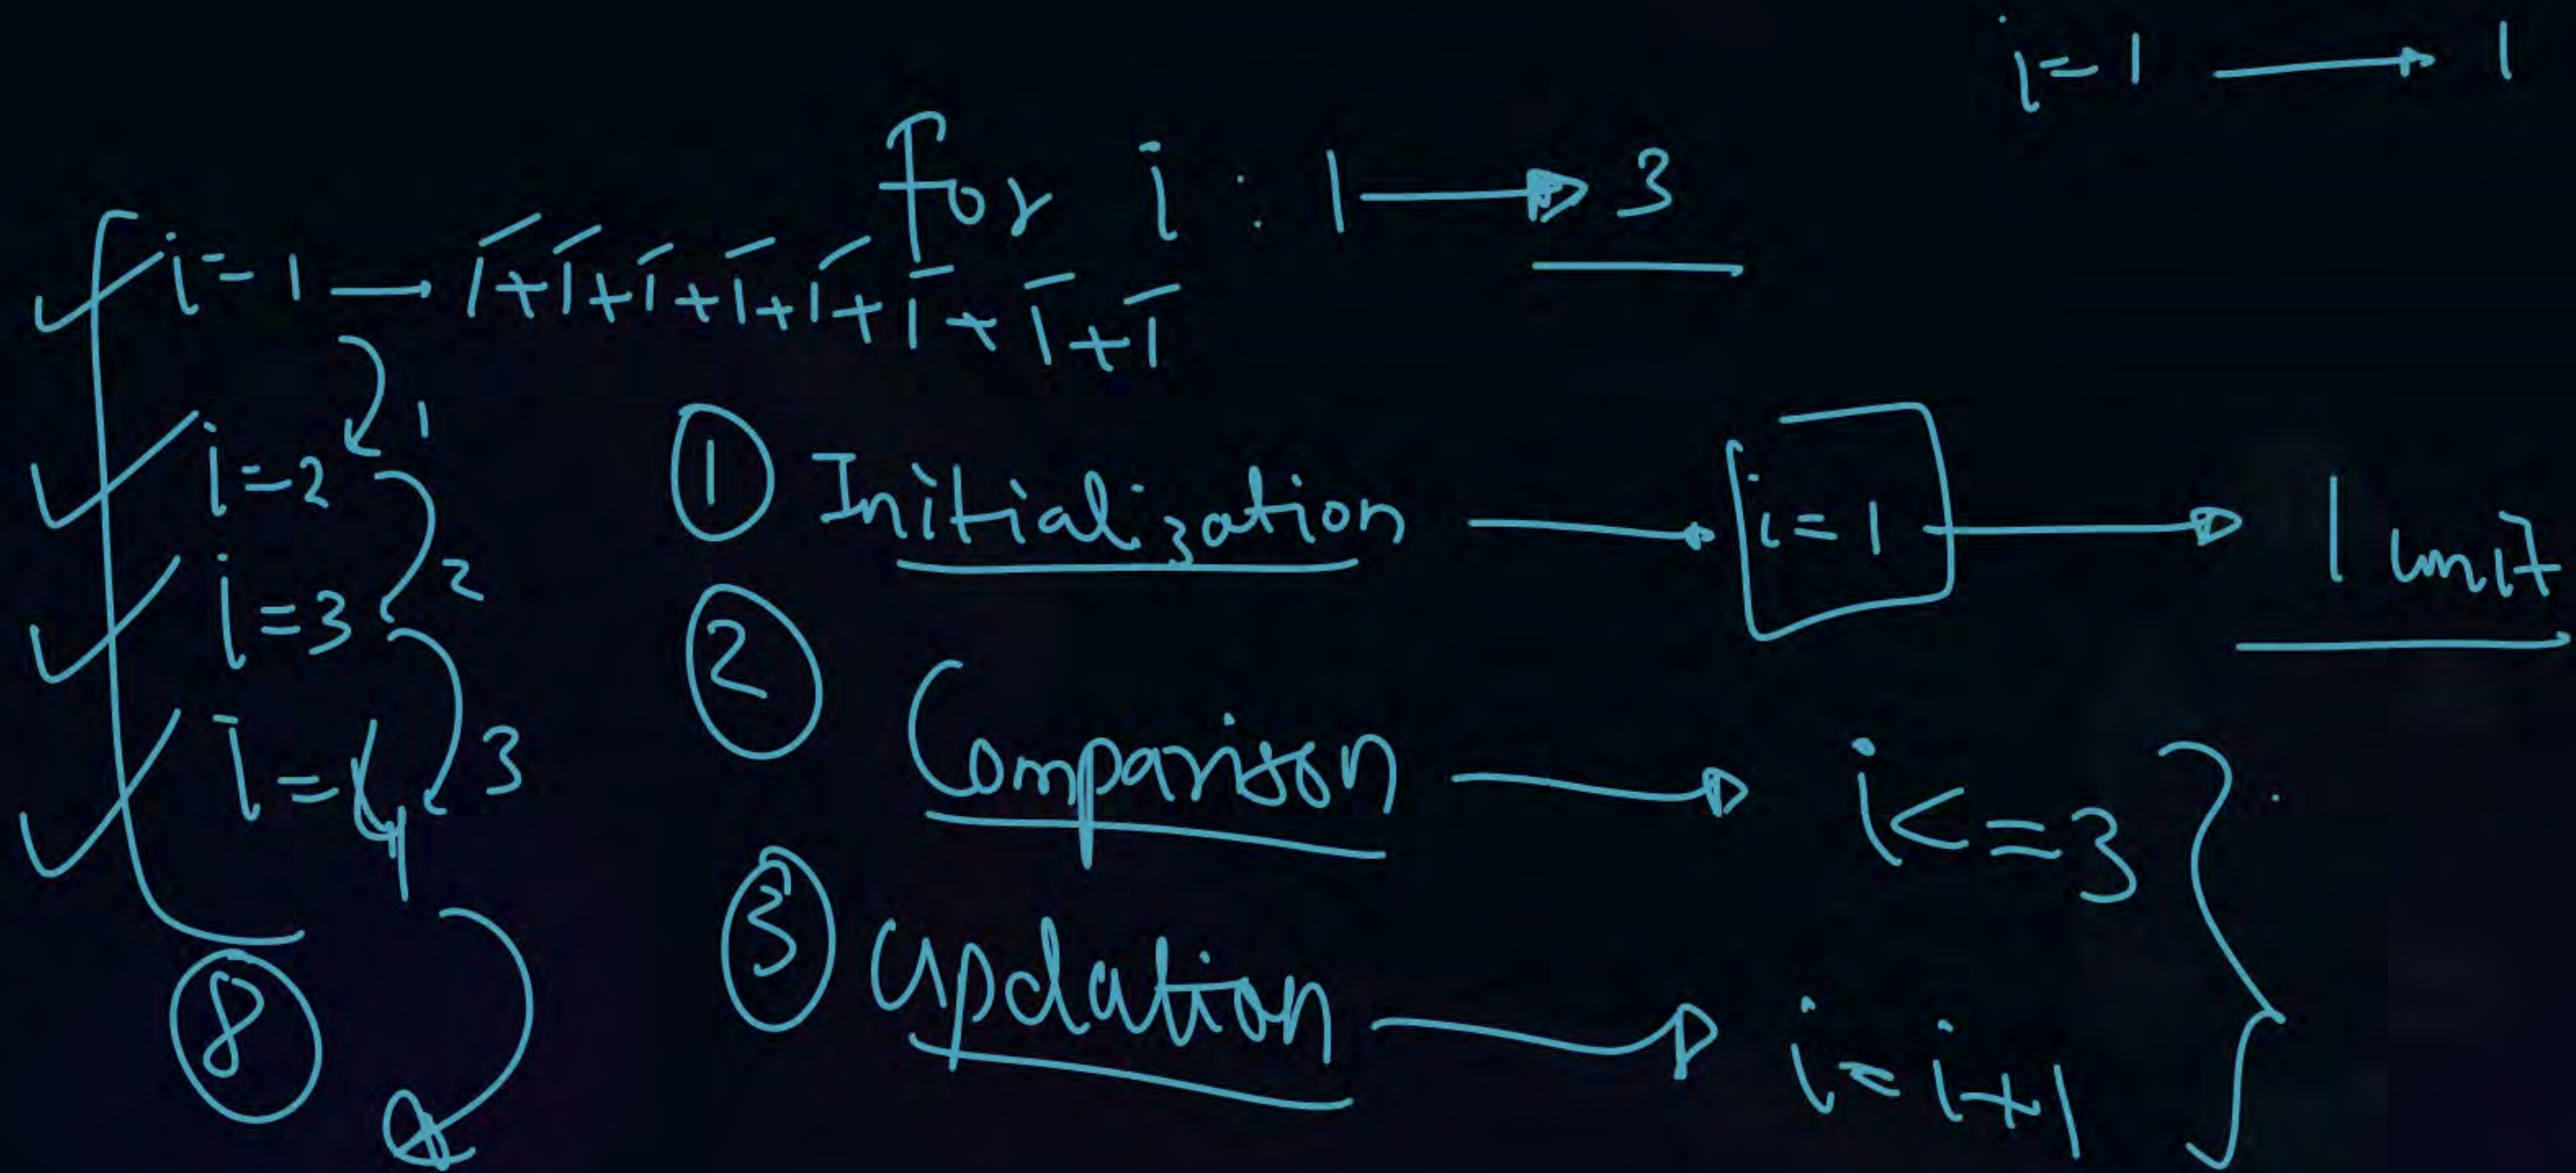

$4n + 2$

Each fundamental operation takes 1 unit time

$2n$

3. for $i: 1 \rightarrow n$
 for $j: 1 \rightarrow n$
 $a = b + c$
}

$(4n^2 + 4n + 2)$

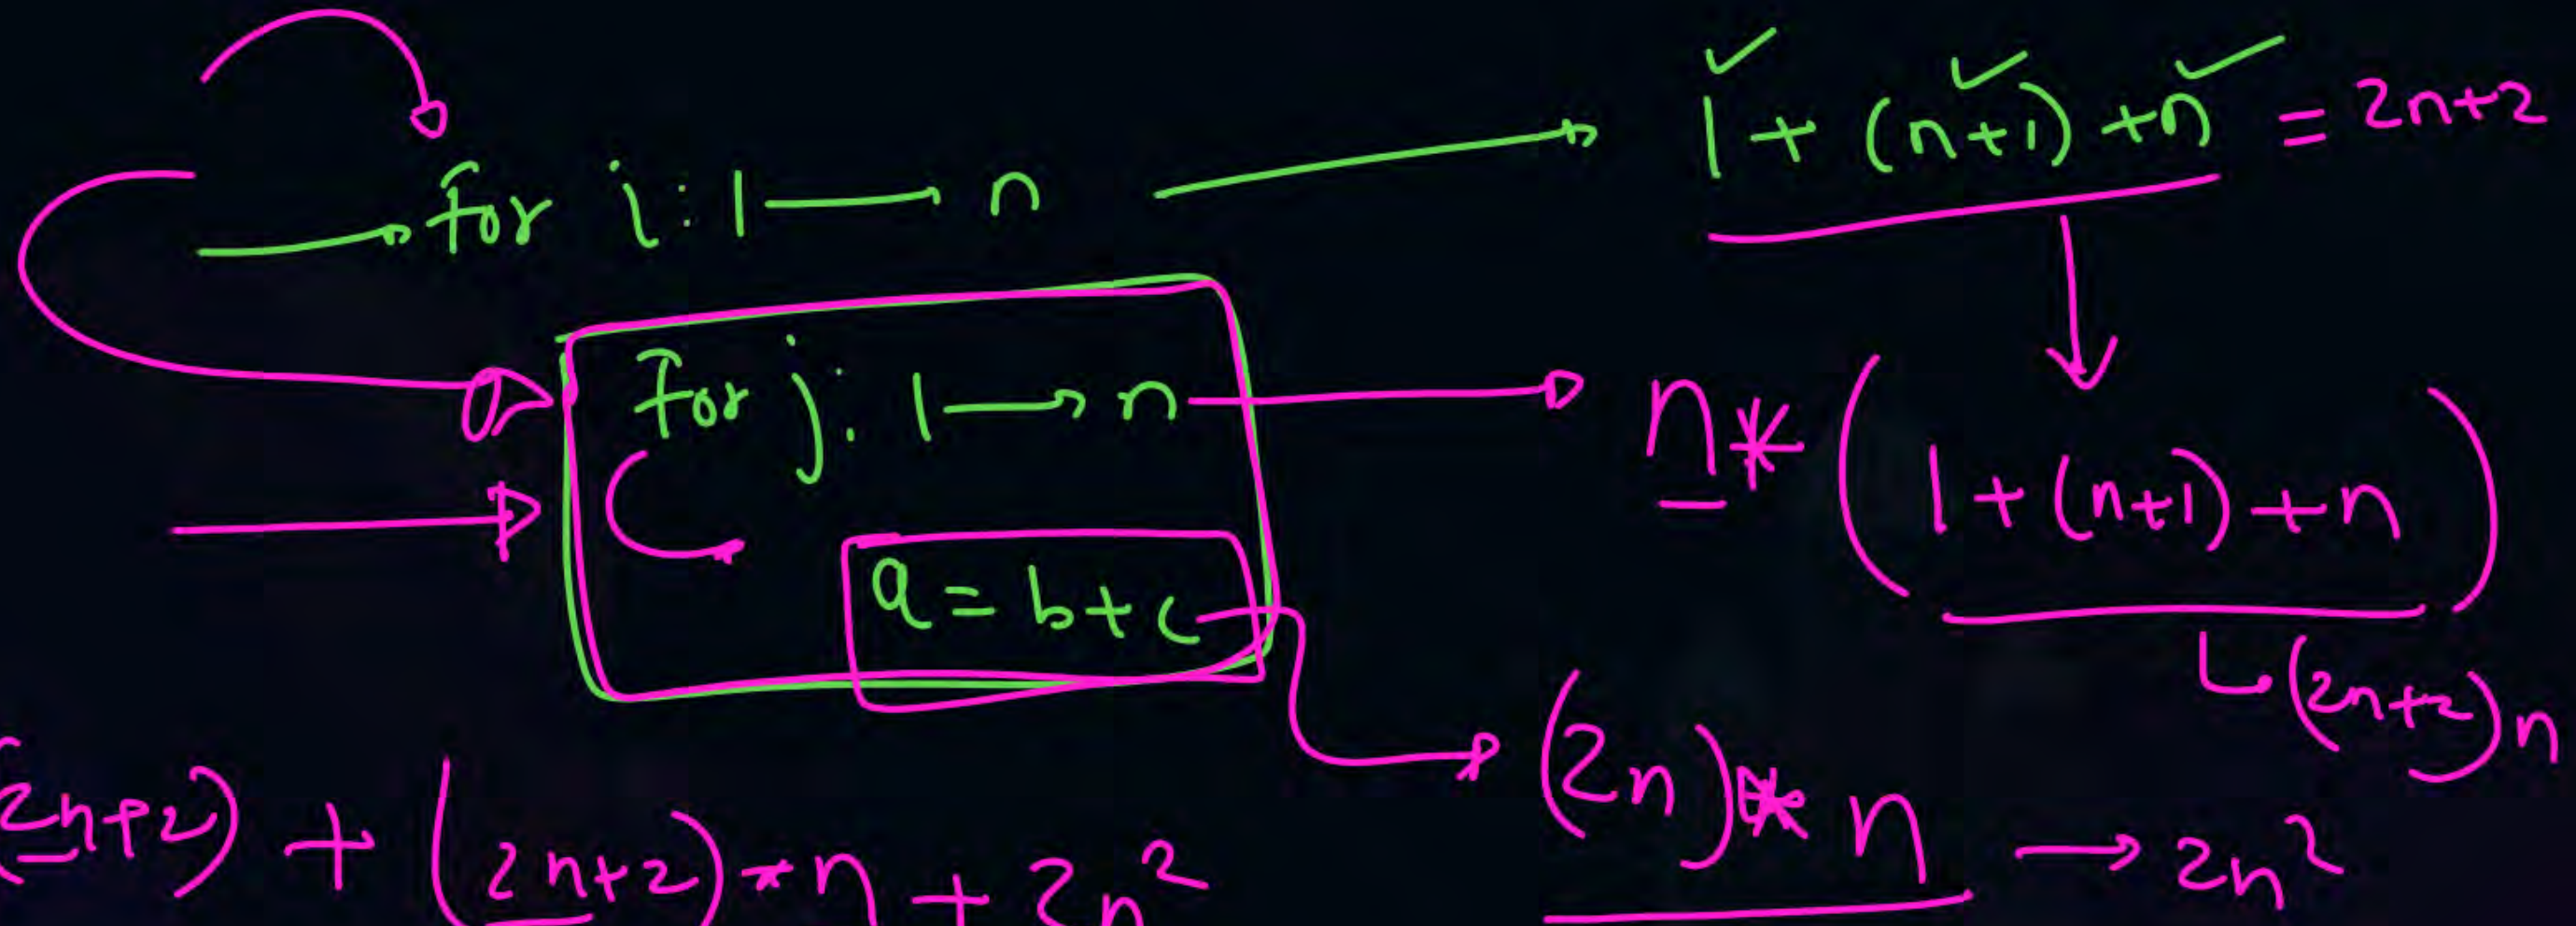

for $i : 1 \longrightarrow n$:

① initialization: $\longrightarrow 1$

② Comparison: $\longrightarrow \underline{n+1}$

③ Updation: $\longrightarrow \underline{n}$

① ② ③

↓ ↓ ↓

Total time :- $2 + (4n+2) + (4n^2+4n+2)$

$= (4n^2 + 8n + 6)$ units

Asymptotic Notation ✓

↓

$O(n^2)$

→ next line

Linear Search

x
