Error Control

Lecture No-5

TOPICS TO BE COVERED

CRC

Cyclic Code

Cyclic code:

- Cyclic code are special Linear Block codes with one extra property.
- ➤ In Cyclic code, if a codeword is cyclically shifted (rotated), the result is another codeword.

Suppose, C is a Code Word given as

$$C = [C_1, C_2, C_3 \dots C_{n-1}]$$

Then after cyclic shifts

Right Shift

$$C = [C_1, C_2, C_3 \dots C_{n-1}]$$

$$C^0 = [C_{n-1}, C_1, C_2 \dots C_{n-2}]$$

$$C^1 = [C_{n-2}, C_{n-1}, C_1 C_2, \dots C_{n-3}]$$

Or

$$C_1 C_2 C_3 C_4$$

 $C_4 C_1 C_2 C_3$
 $C_4 C_1 C_2 C_3$

Left
Shift $C = [C_1, C_2, C_3 \dots C_{n-1}]$

$$C^0 = [C_2, C_3 \dots C_{n-1}, C_1]$$

Or $C_1 C_2 C_3 C_4 \qquad C_1 C_2 C_3 C_4$ $C_2 C_3 C_4 C_1 \qquad C_2 C_3 C_4 C_1$

Linear Block codes:

- ➤ A Linear block code is a code in which the XOR (⊕) of two valid code words create another valid code word.
- Today all most all error detecting codes are linear block codes: Non Liner block codes are difficult to implement.
- ➤ It is simple to find the minimum Hamming distance for linear block code the minimum Hamming distance is the number of 1's in a Non zero valid code word with the smallest Number of 1's

Ex1:

Valid code word

- (a) 000
- (b) 011
- (c) 101
- (d) 110

XOR(a, b) = 011(valid code word)

XOR(a, c) = 101(valid code word)

XOR(a, d) = 110 (valid code word)

XOR(b, c) = 110 (valid code word)

XOR(b, d) = 101(valid code word)

XOR(c, d) = 011(valid code word)

So above code word is Liner block code.

Min Hamming distance = 2 (min. no. of 1's in the non zero code word)

Cyclic Code

Pw

Ex:

Valid code word

- (a) 0 0 0
- (b) 011
- (c) 101
- (d) 110

Linear Block code

Right shift

- 011
- 101
- 110
- 0 1 1

left shift

- 011
- 110
- 101
- 011

Introduction to CRC:

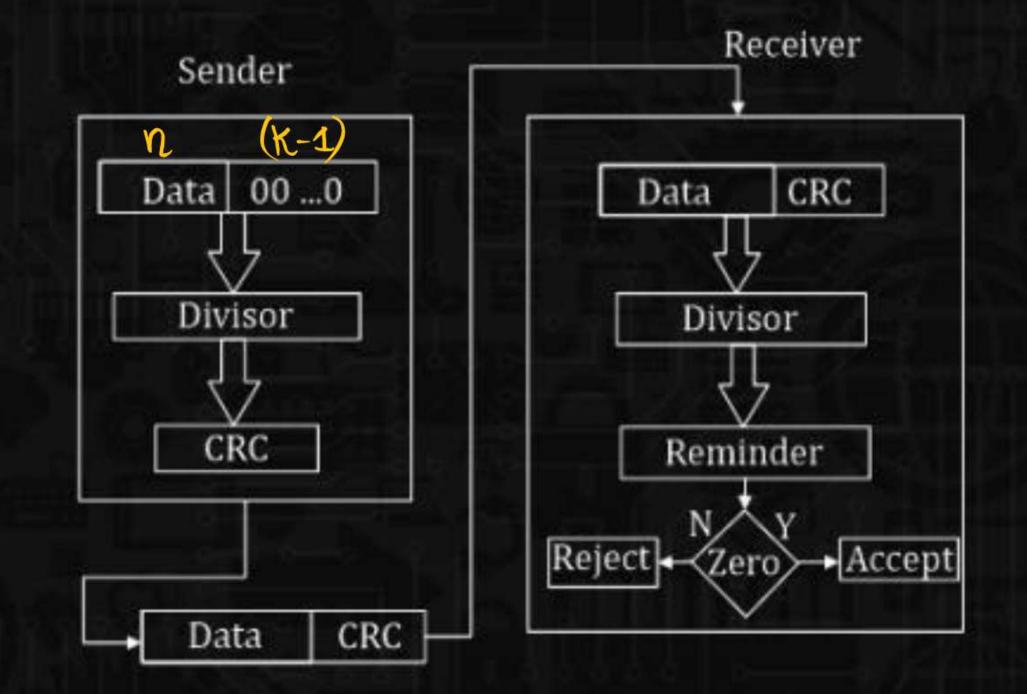

- Length of the dataword=n
- Length of the divisor=k
- > Append (k-1) Zero's to the original message
- Perform modulo 2 division
- Remainder of division = CRC
- \triangleright Code word = (n+k-1) bits

Note: CRC must be (k-1) bits

Codeword = dataword with appended (k-1) Zeros+ CRC

EX- Data=1001001, n=7

Divisor or CRC generator=1101, K=4

Polynomial Notation in CRC

- Data word=d(x)
- \triangleright Codeword=c(x)
- Generator=g(x)
- Syndrome=s(x)
- Error=e(x)

Polynomial Notation in CRC

How to apply the CRC step by step:

- 1. Determine the degree 'r' of g(x) (highest power) $\frac{g(x)}{g(x)} = \frac{\chi^6 + \chi^3 + 1}{\chi^6 + \chi^3 + 1}$
- 2. Determine $x^{r}d(x)$
- 3. Determine the remainder by dividing $x^{r}d(x)$ by g(x)
- 4. Codeword= $x^rd(x)$ +remainder or crc

Q.1

Consider the cyclic redundancy check (CRC) based error detecting scheme having the generator polynomial $X^3 + X + 1$. Suppose the message $m_4 m_3 m_2 m_1 m_0 = 11000$ is to be transmitted. Check bits $c_2 c_1 c_0$ are appended at the end of the message by the transmitter using the above CRC scheme. The transmitted bit string is denoted by $m_4 m_3 m_2 m_1 m_0 c_2 c_1 c_0$. The value of the check bit sequence $c_2 c_1 c_0$ is
